

**Module 8**  
**Balancing Water Supply Demand**

**Ziad Mimi**  
**Birzeit University**

A vertical photograph of a waterfall cascading down a rocky ledge, with green foliage in the foreground and background. The image is partially obscured by a blue slide background.

## Module objectives

---

- Discuss water related problems in the ESCWA region.
- Discuss the available options for closing the supply-demand gap in ESCWA countries.
- Describe planning criteria within the IWRM principals.
- Develop a decision process to select suitable options to meet supply demand gap.
- Demonstrate the approach of balancing supply and demand by an exercise.

# A Unique Resource

---

- Every organism, individual, and ecosystem on the planet depends on water for survival.
- Water impacts all aspects of life on the planet
- Poor water management and water shortages can lead to disease, malnutrition, reduced economic growth, social instability, conflict, and environmental disaster.

# The Global Water Budget

<u>Global Water</u>		<u>Global Freshwater</u>	
97%	Seawater	87%	Not Accessible
3%	Freshwater	13%	Accessible (0.4% of global)

## Global Water Scarcity

A vertical photograph of a waterfall cascading down rocks, with green foliage in the foreground and background. The image is partially obscured by the blue background of the slide.

## Causes of Water problems in the ESCWA:

---

- Lack of awareness in the public sector of the need for the rational use and management of water resources;
- Outdated water legislation and non-existent enforcement mechanisms;
- Fragmented water institutions and ineffective coordination of related water activities at the national level;

## Causes of Water problems in the ESCWA:

---

- Natural water scarcity owing to the arid, semi-arid and extremely arid climates;
- Lack of up-to-date information on the quantity and quality of available and potential water resources and of reliable forecasts on water demand;
- The general absence of comprehensive national planning and well-designed policies for water resource exploitation and use and demand projections with overall socio-economic development plans;

A vertical photograph of a waterfall cascading down a rocky ledge, with green foliage in the foreground and background. The image is partially obscured by the blue background of the slide.

## Causes of Water problems in the ESCWA

---

- The absence of technical cooperation between ESCWA member countries at the regional or subregional level in the exploration and development of new resources, particularly of shared rivers or groundwater basins;
- Lack of adequate financial resources to efficiently develop non-conventional water resources, particularly desalination and wastewater reuse facilities, as well as hydraulic structures and distribution systems.

Country/area	Conventional water resources <sup>a/b/c/</sup>				Non-conventional water resources			Water consump.	Utilization %	Groundwater dependency (%)
	Surface water	Ground - water use	Ground-water recharge	Total renewable (mcm)	Desalinated water	Waste-water and drainage reuse	Total renewable and non-conv. res., (mcm)			
Bahrain	0.2	258	100	100.2	75	17.5 (3)*	192.7	350.7	181.99	73.57

# The Water Balancing Act

## Supply

- Quantity (Natural Scarcity, Groundwater Depletion)
- Quality Degradation
- Cost of Options

## Demand

- Increasing in all sectors
- Inefficient use

IWRM

# Integrated Water Resources Management

---

A systematic process for linking water and water-related policy, objectives, and uses to improve decision making in:

- operation and management of natural resources and environmental systems;
- design and implementation of programs and policies.

A coordinating framework for integrating sectoral needs, water and water-related policy, resource allocation, and management within the context of social, economic, and environmental development objectives.

A vertical photograph of a waterfall cascading down rocks, with green foliage in the foreground and background. The image is partially obscured by the blue slide background.

## Why IWRM?

---

- Globally accepted and makes good sense.
- Key element in national water policy.
- Incorporates social and environmental considerations directly into policy and decision making.
- Directly involves the stakeholders.
- Is a tool for optimizing investments under tight financing climate.

A vertical photograph of a waterfall cascading down rocks, with green foliage in the foreground and background. The image is positioned on the left side of the slide.

## Water as a Global Issue

---

- Water crisis has steadily moved up the global agenda
- The process is driven by
  - water-related health impacts,
  - rapid industrialization,
  - water security, and
  - awakening environmental consciousness

A vertical photograph of a waterfall cascading down rocks, with green foliage in the foreground and background. The image is partially obscured by the blue slide background.

# Key Water Challenges and Needs

---

- Integrated management of water
- Water resources economics
- Political economy of water
- Water supply and sanitation services
- Irrigation/drainage
- NRM and environment
- Water pricing and cost recovery
- Water entitlement and rights
- Water users empowerment
- Sharing of water and its benefits
- Cooperation and conflict resolution
- Energy

## Balancing supply and demand consists of the following activities

- Water Demand analysis
- Water resources assessment (WRA)

# The main strategic options in various countries of the ESCWA region

## Examples...

Strategic options	
<b>I. Options for an optimal utilization of the existing water resources</b>	<b>In countries</b>
Increasing water efficiency through the minimization of water losses in all uses of surface and groundwater sources and leakage control.	Egypt, Jordan, Bahrain, the Syrian Arab Republic, Saudi Arabia, Yemen, United Arab Emirates, Lebanon
Motivating the use of water-saving devices in the household and industrial sectors	Jordan and Saudi Arabia
Re-structuring domestic water tariffs to cover at least O&M costs	Egypt, Jordan, the Syrian Arab Republic, Lebanon, Bahrain, Yemen, the West Bank and Gaza Strip

# Examples.....

<b>II. Options for developing new water resources</b>	
Establishing recharge dams and other hydrological structures to increase reservoir of groundwater	Lebanon, Bahrain, the Syrian Arab Republic, Yemen, United Arab Emirates
Cloud seeding/harvesting	The Syrian Arab Republic and Yemen
Desalination of sea water	All GCC countries and Yemen
Desalination of brackish groundwater	Egypt
Assessing the potential of utilizing brackish water	Jordan
Harvesting rainfall and flash flood waters	Egypt
Evaluating groundwater and surface water potentialities, especially in critical basins	Jordan
Investigating use of seawater for cooling machines	Lebanon

# Examples.....

<b>III. Options for water quality management</b>	
Treating industrial wastewater before discharging it into the river or other water bodies	Egypt, Jordan, Yemen
Collecting domestic sewage and treating it before it is discharged back into the system	Egypt, Jordan, GCC countries, Yemen
Controlling and reducing the amount of agrochemicals (fertilizers, pesticides and the other added chemicals)	Egypt
Expanding well-field protection zones	Bahrain
Carrying out an environmental impact assessment for each water project	The West Bank and Gaza Strip

# Examples...

<b>IV. Options for capacity building and creating a better environment for potential reforms in water management</b>	In countries
Enhancing training and increasing skills of human resources in the water sector	All countries
Improving data and information systems	All countries
Restructuring water institutions to achieve financial and administrative decentralization and autonomy	Jordan, the West Bank and Gaza Strip, Yemen
Updating legislation, reviewing regulations and enhancing enforcement	Lebanon, Egypt, Yemen, Bahrain, Saudi Arabia, United Arab Emirates
Initiating an intensive public awareness programme to stimulate water conservation	Egypt, Jordan, Saudi Arabia, United Arab Emirates, Bahrain, Yemen, the West Bank and Gaza Strip.

## **Description of planning criteria**

---

### **A. Financial viability**

- 1. Fundability**
- 2. Unit cost of water, dollars per cubic meter**
- 3. Affordability**

## **Description of planning criteria....**

---

### **B. Technical viability**

- 1. Availability of technology**
- 2. Implementability**
- 3. Flexibility and reliability of technology**
- 4. Feasibility**
- 5. Water resources knowledge**

A vertical photograph of a waterfall cascading down a rocky ledge, with green foliage in the foreground and background. The image is partially obscured by the blue background of the slide.

## **Description of planning criteria....**

---

### **C. Source viability**

- 1. Availability and hydrologic certainty of the source**
- 2. Sustainability of quantity and quality**
- 3. Flexibility of Supply development**

A vertical photograph of a waterfall cascading down rocks, with some green foliage in the foreground and dark leaves in the top left corner. The image is partially obscured by a blue overlay on the right side.

## **Description of planning criteria....**

---

### **D. Political viability**

- 1. Willingness of participants**
- 2. Political certainty of the source country**
- 3. Compatibility with the international laws and the existing agreements.**

## **Description of planning criteria....**

---

### **E. Institutional viability**

- 1. Availability and capacity**
- 2. Reliability of institutions**

### **F. Environmental viability**

- 1. Impacts on the built environment**
- 2. Impacts on the physical and natural environment**

## **Description of planning criteria....**

---

### **G. Social viability**

- 1. Public acceptance**
- 2. Fulfillment of development needs**

# Screening of options

Tableau Used in Multicriterion Decision Making  
A: Alternatives and C: Criteria

	$A_1$	$A_2$	....	$A_n$
$C_1$				
$C_2$				
$C_n$				

- 
- 
- Symbolically, if  $w_i$  is the weight assigned to the  $i$ th planning criterion by members of the Focus Group, and if  $r_{ij}$  is the rating of the  $j$ th option with respect to the  $i$ th criterion, the overall score,  $S_j$ , for the  $j$ th option is calculated as:

$$S_j = \sum_{i=1}^n r_{ij} w_i$$

# Case Study

- There is a shortage in an area in water and we want to fill the gap between demand and Supply. What we can do??

# 1. List all possible options

No.	Option
1	Development of local groundwater sources
2	Supply system improvements- municipal sector
3	Water conservation –municipal sector
4	Supply System improvement-- agriculture sector
5	Water conservation – Irrigated agriculture sector
6	Development of local surface water resources
7	Intensive watershed management
8	Water pricing
9	Intersectoral reallocation
10	Wastewater reuse
11	Desalination of brackish water
12	Desalination of sea water
13	Medusa bags
14	Cloud seeding
15	Mediterranean Sea-Dead Sea desalination
16	Red Sea-Dead Sea desalination

## 2. Suggested and weights Criteria? Focus group

Financial and economic viability		20%
	Fundability	
	Cost per unit of water	
	Affordability	
Technical viability		13.3%
	Availability of technology	
	Implementability	
	Feasibility	
	Flexibility and reliability of technology	
Source viability		22.4%
	Availability and hydrologic certainty	
	Sustainability of quantity and quality	
	Flexibility of supply development	

# Suggested Criteria

Political viability		21%
	Willingness of participant countries	
	Political certainty of source country	
	Compatibility with international laws	
Institutional viability		7.1%
	Availability and capacity of institutions	
	Reliability of institutions	
Environmental viability		8.8%
	Impacts on the built environment	
	Impacts on the physical and natural environment	
Social viability		7.4%
	Public acceptance	
	Fulfilment of development needs	

# 3. Analysis of options analysis

Example.....

Option No. 1

- **Development of Local Groundwater Sources**
- **Concept:** The total potential renewable groundwater resource in the West Bank is 601Mcm/yr and 78 Mcm/yr of brackish water for further development.
- **Technology/Implementation:** The technology for groundwater extraction is readily available.
- **Costs:** The unit production cost of local groundwater in the West Bank ranges between \$ 0.25 and \$0.30/m<sup>3</sup>. Financing, distribution, and treatment would increase these costs.

# Analysis..

- **Source Water:** From the point of view of hydrologic uncertainty, the availability of the resource is reasonably well known and dependable. Production can be sustained up to the total renewable capacities of the aquifers.
- **Political:** The Palestinian share of the groundwater resources in the West Bank is not yet defined. Therefore, the extent to which the Palestinians may develop these resources in the future is a function of the Final Status Negotiations. Utilisation of groundwater resources would provide Palestinians with a high degree of independence in the control of their water resources.
- **Institutional:** Management institutions necessary for effective utilisation of groundwater resources would not have any out-of-the-ordinary or exceptional staffing, training, or manpower requirements.

# Analysis...

- **Environmental:** The development of conventional water sources must take into account the sustainability of these resources. Groundwater development must be performed so that safe yield of aquifers is not exceeded.
- **Social:** Public acceptance of the use of additional groundwater supplies would be limited only by the price charged to water users.

# Calculations...

Criteria		Weights		
		Mean	Option 1	Option 2
Financial and economic viability		20	3/5	5/5
	Fundability			
	Cost per unit of water			
	Affordability			
Technical viability		13.3	2/5	4/5
	Availability of technology			
	Implementability			
	Feasibility			
	Flexibility and reliability of technology			

# Calculation...

Source viability		22.4	1/5	5/5
	Availability and hydrologic certainty			
	Sustainability of quantity and quality			
	Flexibility of supply development			
Political viability		21	2/5	1/5
	Willingness of participant countries			
	Political certainty of source country			
	Compatibility with international laws			

# Calculations

Institutional viability		7.1	4/5	2/5
	Availability and capacity of institutions			
	Reliability of institutions			
Environmental viability		8.8	4/5	3/5
	Impacts on the built environment			
	Impacts on the physical and natural environment			

# Selection?

Social viability		7.4	3/5	5/5
	Public acceptance			
	Fulfilment of development needs			

Based on the above table we can see that:

$$\text{Score of option 1} = 20 * 3/5 + 13.3 * 2/5 + 22.4 * 1/5 + 21 * 2/5 + 7.1 * 4/5 + 8.8 * 4/5 + 7.4 * 5/5 =$$

$$\text{Score of option 2} = 20 * 5/5 + 13.3 * 4/5 + 22.4 * 5/5 + 21 * 1/5 + 7.1 * 2/5 + 8.8 * 3/5 + 7.4 * 5/5 =$$

The option who has the highest score is better.
